Benefits of using cloud-based capital program management software

Investing in a cloud-based capital program management software system saves money by boosting productivity and collaboration. It also reduces pre- and post-implementation project costs. Here are a few ways in which cloud-based capital program management solutions can provide return on investment in terms of time, resources, and money saved.

Productivity

5 years

$6 trillion

can be lost over five years in global construction due to a delivery delay by one year

$5 billion

$450 million net benefit

A $5 billion project can gain a $450 million net benefit by implementing a capital program management solution

A capital program management solution can significantly boost productivity levels within an organization.

30%

higher labor productivity is seen in construction projects with higher levels of automation

25%

gain in productivity with detailed execution planning

Cost savings

Only **31%** of projects come within 10% of their budgets

Having a robust cloud-based solution in place will help you stay on top of your projects, with real-time reporting available at every stage of your capital project—from planning to maintenance.

4.3%

average cost savings from implementing an enterprise-wide capital program management solution

10%–20%

savings in IT spend by switching to a cloud-based system

8%–12%

can be achieved in annual savings by organizations that implement an asset lifecycle management solution

The City of Las Vegas generates its CIP book automatically, **saving 3 to 4 months** each year during the capital planning process

The Utah Department of Transportation **saves $19.5 million annually** (or $100M over five years) during the capital planning process

Connectivity and collaboration

Only **37%** of a normal working day is spent on productive work

A software solution in place helps eliminate various workplace silos and slow information processing that cause delays and holdups.

91% of contractors and owners agree that increased collaboration reduces risk on construction projects

Data storage and management

A capital program management solution helps to digitize data and store it virtually in one easy-to-access location, making sharing the data almost an instant process.

$15.6 billion a year is wasted by inadequate data interoperability in the U.S. capital facilities industry

14% of avoidable rework, costing up to $88 billion, is caused by bad construction data

90% reduction in time for document transmittals by digitizing the processes

Resource management

An effective resource management tool gives you a bird's-eye view of every project.

10%–20% of a budget can be saved through better resource management

98% of projects face the prospect of being over budget and delayed due to the procurement process

Sustainability

Using the cloud as an anchor for your digital systems can help reduce waste (think less paper).

53% of construction executives say the drive for sustainability is expected to accelerate

Reducing risk

An installed capital program management solution can prevent many risks. Retaining all submittals, RFIs, RFPs, change orders, and issues in a single view can help manage risks. Automation and estimation processes can help prevent cost overrun risks.

100+ RISKS

There are more than 100 potential risks you can run into during a project, according to the Chartered Insurance Institute (CII)

aurigo®

$300 billion in capital planning and management, serving 40K capital projects
